7. Integrating a Zoho Creator Application with Another Zoho Service Using Connections and APIs

1. Aim

To integrate the Patient Appointment & Scheduling Management application built in Zoho Creator with Zoho CRM using Zoho Creator Connections and Deluge to prepare patient contact details for automatic transfer to the CRM when an appointment booking form is submitted successfully.

2. Objective

- Learn how to create and authorize a Zoho Creator Connection for authenticated access to a Zoho CRM account.
- Use a Deluge script in a form workflow to read patient details and map fields for a CRM Contact record.
- Configure the automation on successful submission of the appointment form when the patient email address is present.

3. Prerequisites & Tools Required

- Zoho Creator application: Patient Appointment & Scheduling Management.
- Zoho CRM account with Contact creation access; the provided connection is authorized as Zoho CRM Account1.
- An existing Appointment_Booking_Form with the fields used by the workflow:
  - Patient_Name (first name and last name components)
  - Email_Address (Email)
  - Contact_Number (Phone)

The Zoho Creator connection is named **Patient_CRM_Connection** and its link name is **patient_crm_connection**.

4. Step-by-Step Implementation Procedure

Step 1: Setting up the Connection in Zoho Creator

To allow the application to access Zoho CRM without hardcoding authorization tokens, configure a dedicated service connection.

1. Open Zoho Creator and navigate to Microservices to manage the available service connections.
2. Create a connection for the Zoho CRM service and authorize it using the intended CRM account.
3. Set the display name to Patient_CRM_Connection and the link name to patient_crm_connection.
4. Grant the required Create Contact permission for the Contacts operation.
5. Enable Connection Access for Patient Appointment & Scheduling Management.
6. Verify that the connection shows Enabled and that the application has On access with a References link.

Step 2: Identifying the Target API Endpoint

The destination is the Contacts module in Zoho CRM. The configured connection specifies the Create Contact permission. The matching patient data fields are First_Name, Last_Name, Email, and Phone.

- API operation: Create a CRM Contact record.
- Standard REST equivalent: POST https://www.zohoapis.com/crm/v8/Contacts.

The API URL above is the documented REST equivalent; the screenshots do not show the final service invocation or the API version used by this particular script.

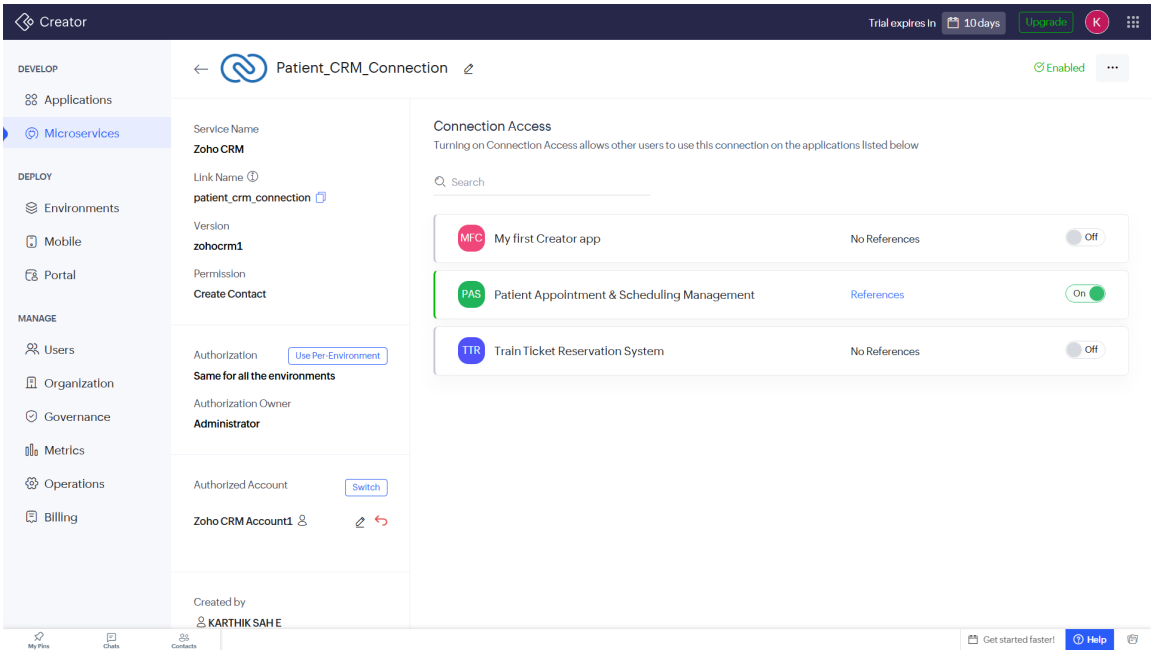

Step 3: Writing the Deluge Script

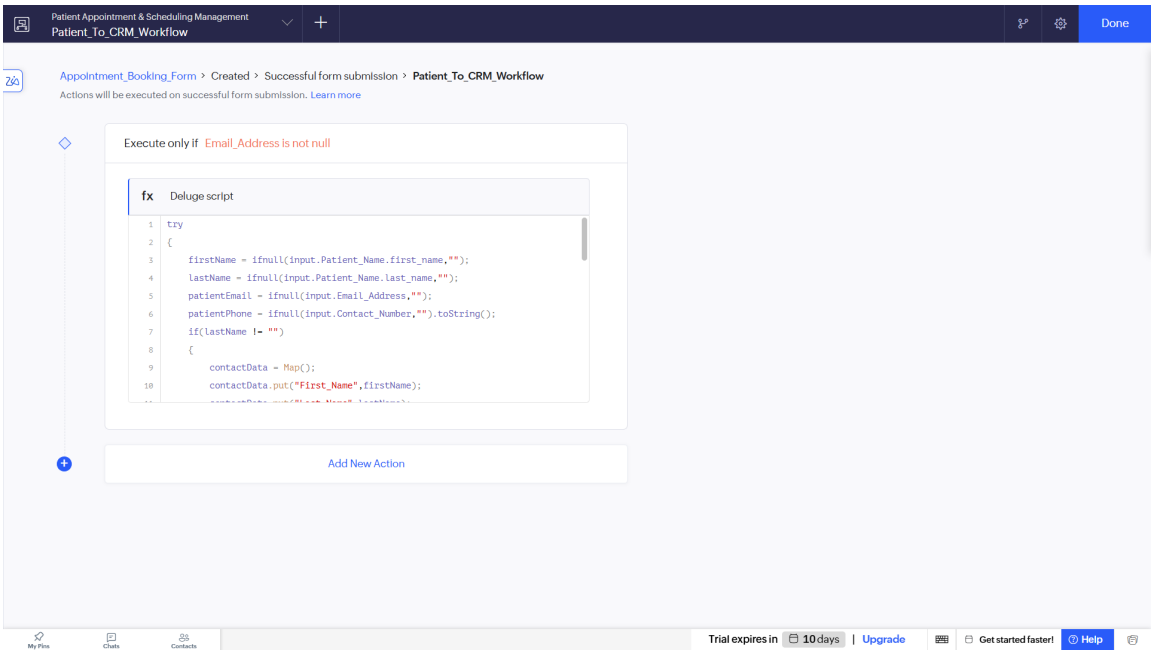

Configure a Form Workflow so that the automation runs after a patient submits the Appointment_Booking_Form successfully.

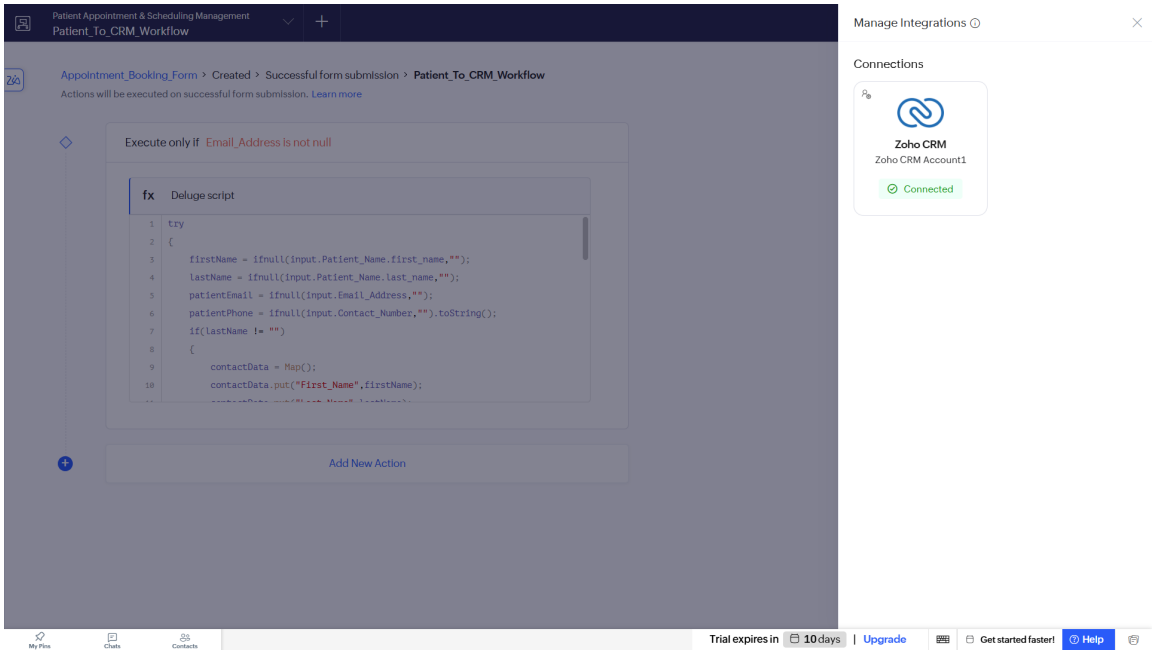

1. Go to Workflow > Form Workflows and create Patient_To_CRM_Workflow.
2. Choose Appointment_Booking_Form > Created > Successful form submission as the event.
3. Under the condition Email_Address is not null, add a Deluge script action.
4. Read Patient_Name.first_name, Patient_Name.last_name, Email_Address, and Contact_Number, using ifnull() for missing values.
5. Use a non-empty Last_Name check and prepare a Contact data map for transfer to Zoho CRM. Confirm the authorized Zoho CRM connection in Manage Integrations.

The visible portion of the Deluge action shows field extraction and data-map preparation; it does not display a final API response or a newly created CRM Contact.

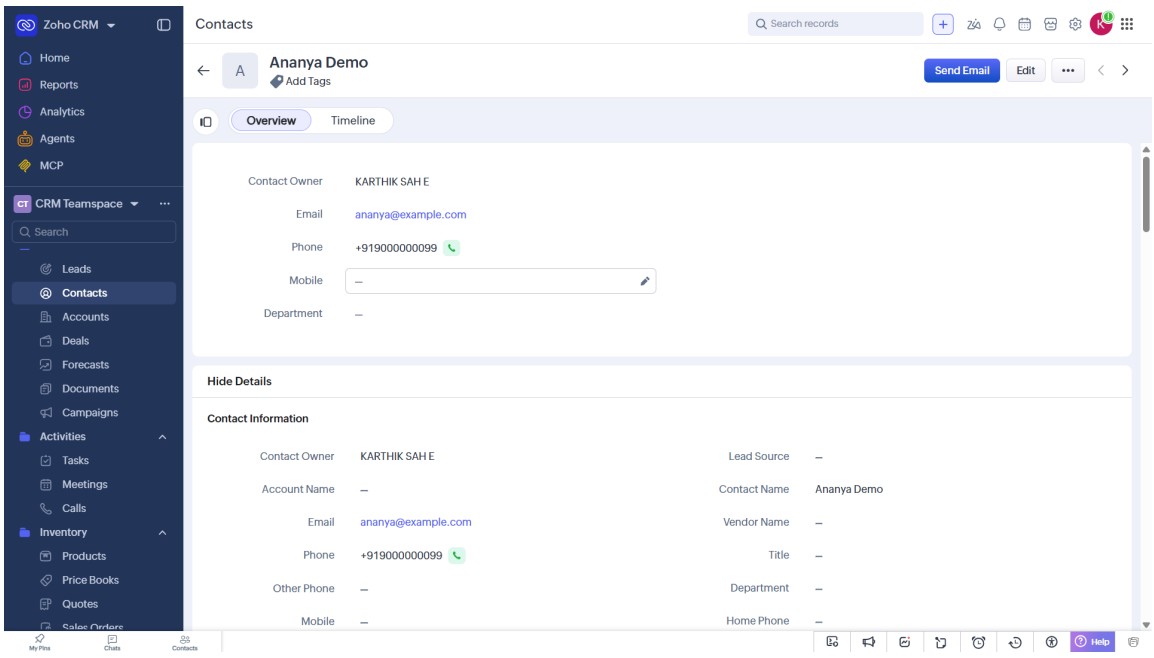

Screenshots:

Zoho CRM Contact Record:

Result:

The Patient Appointment & Scheduling Management application was integrated with Zoho CRM using a Zoho Creator connection and the Patient_To_CRM_Workflow. The connection is enabled, and the workflow is configured to process successful appointment-form submissions. The Zoho CRM Contacts list displays the patient contact Ananya Demo with email ananya@example.com and phone +919000000099, demonstrating that the patient contact record is present in Zoho CRM.
