# 11.Deploying a Zoho Creator Application from Development

## 1. Aim

To migrate, publish, and deploy the Patient Appointment & Scheduling Management application from the Development Environment to the Production Environment using Zoho Creator deployment and migration tools, ensuring reliable access for authorized clinic administrators, doctors, and patients.

## 2. Objective

- Understand the difference between Development, Stage, and Production environments for application building, testing, and live appointment management.
- Learn how to use Zoho Creator Environments to promote tested forms, reports, pages, and Deluge workflows.
- Verify environment-specific connections, credentials, and user permissions before and after deployment.

## 3. Prerequisites & Tools Required

- Zoho Creator account with Administrator or Developer privileges.
- Patient Appointment & Scheduling Management application with booking forms, reports, dashboard, and workflows prepared in Development.
- Stage and Production environments available within the same Zoho Creator organization.

## 4. Step-by-Step Implementation Procedure

### Step 1: Pre-Deployment Verification and Clean-Up

Before promoting application changes, verify that the existing appointment-management components are complete and functioning correctly.

1. Open the Patient Appointment & Scheduling Management application in the Zoho Creator builder.
2. Review Appointment_Booking_Form, Doctors, appointment reports, Clinic_Command_Center_Page, and Deluge workflows such as Validate_Appointment and Auto_Fill_Patient_Email.

3. Inspect execution logs for workflow failures and verify that the appointment booking, reports, dashboard, and access permissions work as intended.
4. Use fictional test appointments for validation and remove temporary records only where appropriate. Check external Zoho CRM connections and notifications before live use.

## Step 2: Accessing the Deployment / Environment Promotion Tool

Zoho Creator uses an Environments workspace to manage promotion from Development to Stage and Production.

1. Open the Zoho Creator home dashboard and navigate to Deploy > Environments.
2. Choose Add Application and select Patient Appointment & Scheduling Management if it has not been added to the Environments workspace.
3. Review the warning about developer access before adding the application. Confirm the selection to initialize the deployment environment.
4. Confirm that the application appears in the Development listing and that its Stage and Production columns are available.

### Step 3: Reviewing Component Changes and Dependencies

Before publishing any new version, review the components and dependencies included in the deployment.

1. Review forms and fields such as Appointment_Booking_Form, its Appointment_Services subform, and the Doctors form.
2. Review reports and dashboards including My_Appointments, All_Appointments_List, appointment-status analytics, doctor-wise summaries, and Clinic_Command_Center_Page.
3. Review workflows and scripts including appointment validation, confirmation messages, reminders, and Patient_To_CRM_Workflow.
4. Verify connection authorization and environment-specific settings for any integrated Zoho services.

### Step 4: Executing the Deployment

1. If changes are available, use Publish > Publish to Stage, review the changes and dependencies, and confirm Stage publication.
2. Test the Stage version. After successful verification, use Publish > Publish to Production and confirm the deployment.
3. Check the version displayed in Stage and Production. The supplied Environments screenshot shows version 1.0 in both columns.

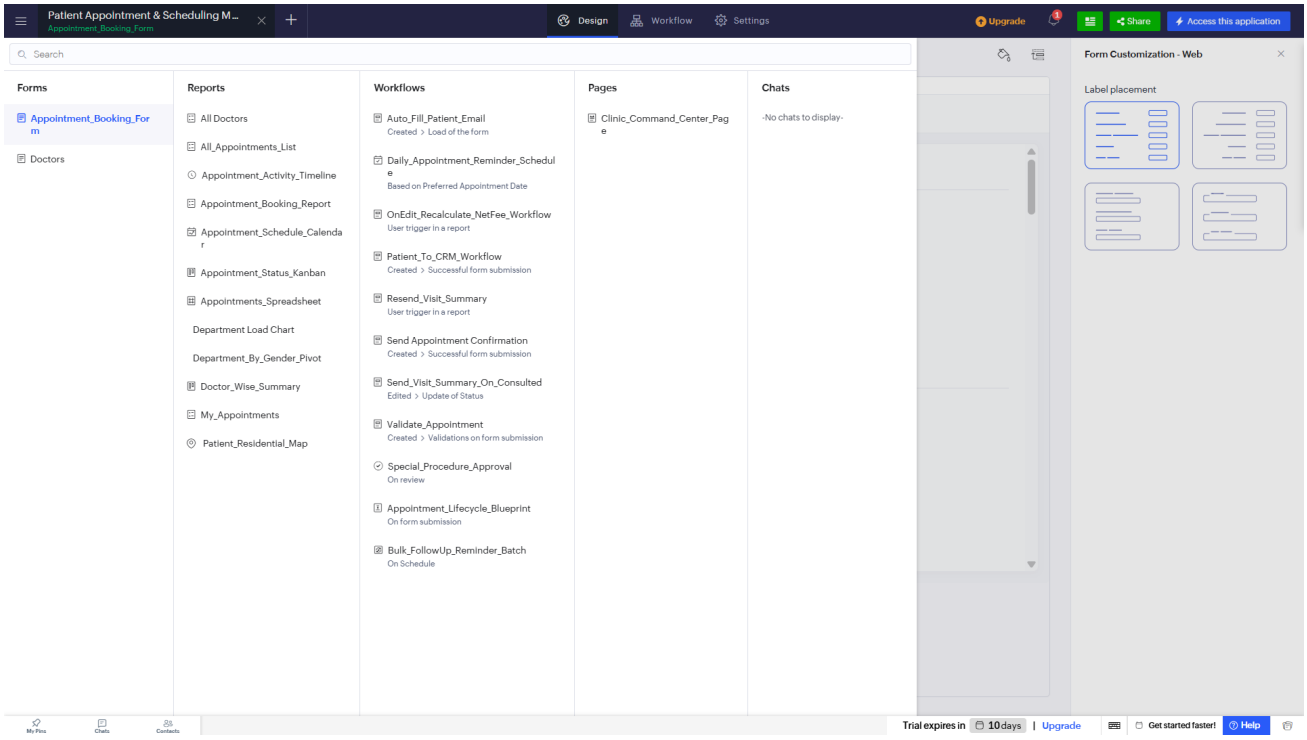

## Step 5: Post-Deployment Access and Sharing

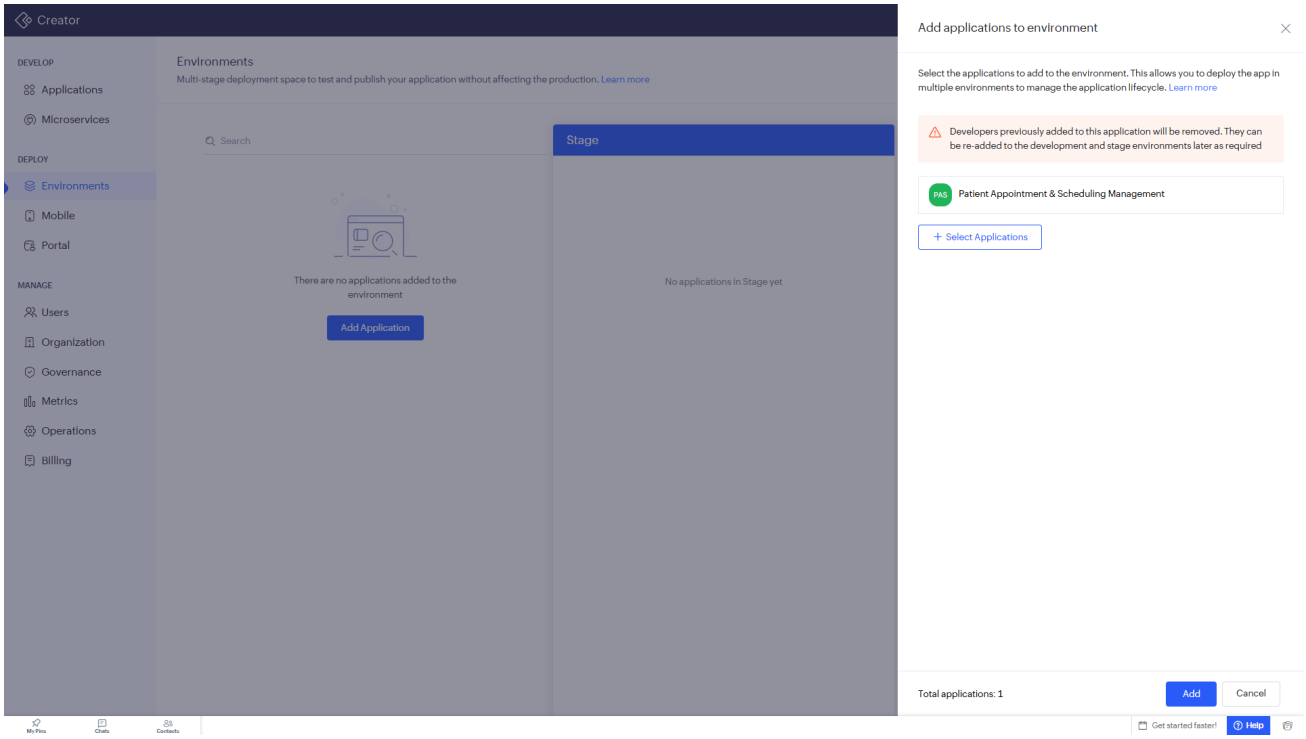

1. Open the application from the Production environment or its live application link.
2. Confirm that the production application loads and that its forms, reports, Clinic Command Center dashboard, and appointment workflows operate as expected.
3. Recheck permissions for the CEO/Admin, Doctor, and Patient roles, including Doctor_Permission and Patient_Permission.
4. Check external connections and automated communications with safe test records before permitting real patient information.

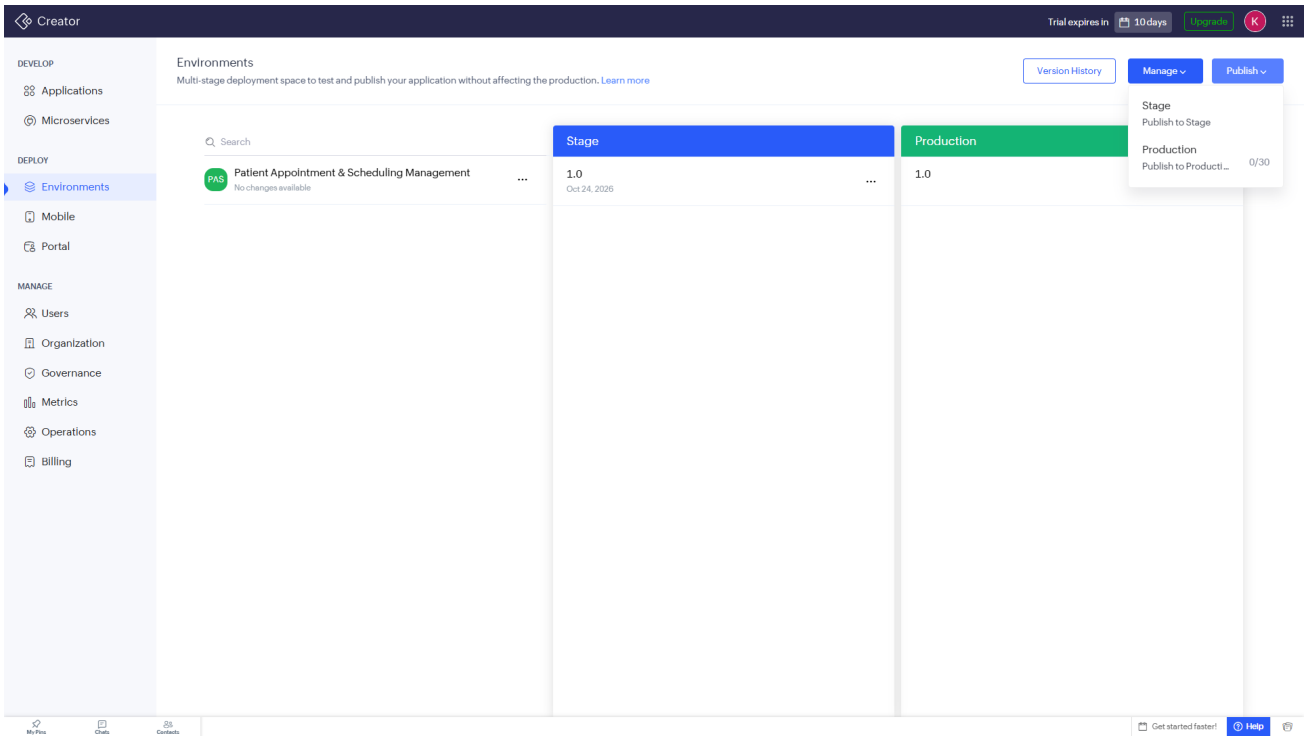

The Environments view shows Stage version 1.0 and Production version 1.0 with "No changes available" in Development. The screenshots do not independently demonstrate a completed live-user access or workflow test.

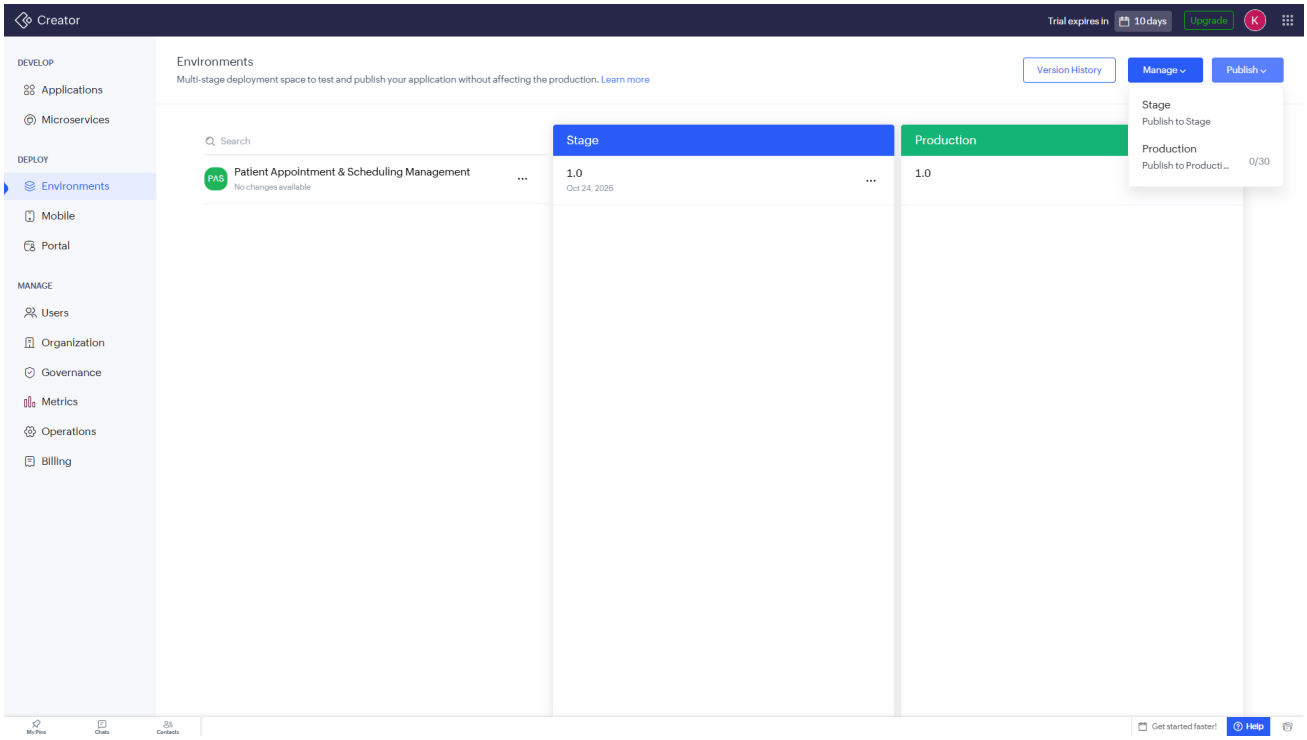

# 5. Screenshot

The following screenshots show application preparation, addition to Zoho Creator Environments, and the Stage/Production version view.

# 6. Result

The Patient Appointment & Scheduling Management application was added to Zoho Creator Environments, and the deployment workspace displayed version 1.0 under both Stage and Production. The experiment demonstrated the development-to-production application lifecycle, including component review, deployment management, and the need to verify forms, workflows, integrations, and role-based permissions before live patient use.
